Davidson County Mortality Report, 2003

This report is developed in the public domain and may be used and reprinted without special permission. Citation to source, however, is appreciated. Suggested citation: "Division of Epidemiology and Research, Metro Public Health Department of Nashville and Davidson County: Davidson County Mortality Report, 2003." 2005.

Selected Highlights 2003 Mortality for Davidson County

Deaths by Sex, Race, and Age

In 2003, there were 5,187 deaths among Davidson County residents. Of these, 2,533 or 48.8% were male and 2,654 or 51.2% were female. Nearly three-fourths of the deaths were White (74.6%) while 24.8% were Black, and less than 1.0% were of another race or unidentified. Nearly 69% of all deaths among Davidson County residents were of persons aged 65 and older. Nearly 41% of males died before age 65 compared to 23% of females.

Death Rates by Sex and Race

The 2003 crude death rate (number of deaths per 100,000 population) in Davidson County was 890.5 overall; 893.0 for males and 888.2 for females; 955.7 for Whites and 818.4 for Blacks. When stratified by sex and race, White females had the highest death rate (980.8), while Black females had the lowest death rate (747.7).

Infant Mortality

There were 69 deaths among children less than one year old in Davidson County in 2003. The infant mortality rate (infant deaths per 1,000 live births) was 6.0 for Whites and 11.9 for Blacks. Black infants died at a rate that was twice as high as the rate for Whites. The overall infant mortality rate (7.8) in 2003 was 24.3% lower than the rate in 2002.

Leading Causes of Death

The three leading causes of death among Davidson County residents in 2003 were heart disease, cancer, and stroke. These 3 causes accounted for nearly 55% of all the deaths in the county in 2003. The other leading causes of death, based on age-adjusted death rates, were chronic lower respiratory diseases, accidents, Alzheimer's disease, diabetes, influenza and pneumonia, nephritis, and chronic liver disease. Males were more likely to die due to HIV-related disease, homicide, and suicide than females, while females were more likely to die due to HIV-related disease and homicide than Whites, while Whites were more likely to die due to suicide and chronic liver disease.

Comparison with Tennessee and United States

In 2003, the age-adjusted death rate for all causes in Davidson County was lower (2.6%) than the corresponding rate for Tennessee. Similarly, when age-adjusted rates for sex and racial categories were compared, Davidson County rates were lower than Tennessee rates with the exceptions of the death rates for all Blacks and Black males. Compared to the rates for the United States, the age-adjusted death rates for Davidson County and for each race and sex category were substantially higher. The age-adjusted rate for stroke in Davidson County was comparable to the Tennessee rate. The county age-adjusted death rates for Alzheimer's disease, influenza and pneumonia, accidents, chronic lower respiratory diseases, heart disease, cancer, and diabetes were all lower than the rates for the state. The age-adjusted death rates for nine of the ten leading causes of death in Davidson County were higher than the comparable rates for the United States; the one exception was nephritis. For the 6 leading causes of death and infant mortality for which there is a corresponding Healthy People 2010 objective, the Davidson County rate falls short of each objective goal with the exception of diabetes.

Deaths and Deaths by Sex, Race, and Age

Number of Deaths by Sex, Race, and Age

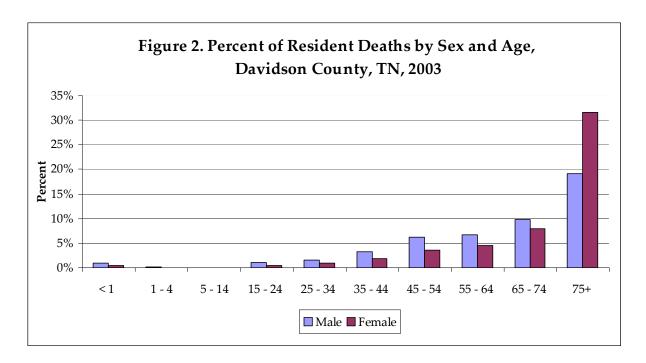

n 2003, there were 5,187 deaths among residents of Davidson County. Of these, 2,533 (48.8%) were males and 2,654 (51.2%) were females. Examining death by race shows that 3,868 (74.6%) deaths were White, 1,285 (24.8%) deaths were Black, and 34 (0.7%) were of another race or unidentified.

This distribution by sex and race closely parallels the demographic distribution of the general population. According to the 2000 census, the population of Davidson County was 569,891. Population estimates provided by the Tennessee Department of Health (TDH) for the year 2003 indicate 582,462 persons living in Davidson County, a 2.2% increase since the 2000 census. In 2000, the racial composition was approximately 69% White, 26% Black, and 7.1% other races. Between the year 2000 and 2003, the population proportion for both Blacks (27.0%) and Whites (69.5%) increased, while the proportion for other races (3.6%) decreased. The distribution by sex is estimated to be the same as in 2000, approximately 48% male and 52% female. There is no difference in the percentage of persons aged 65 and older (11.1%) from the year 2000 to the year 2003.

The number of deaths in Davidson County has consistently remained around 5,000 deaths per year since 1993. Since 1999, there has been a slight increase in the number of deaths each year, in proportion with population increases. (See Figure 1)

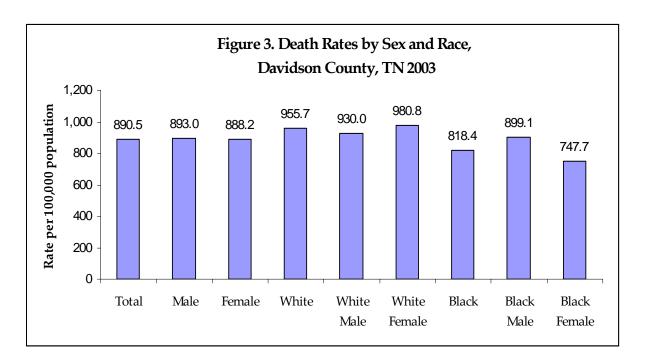

Nearly 69% of all Davidson County resident deaths in 2003 were of persons aged 65 and older. Nearly 41% of males died before reaching age 65 compared to 23% of females. (**See Figure 2 on page 2**)

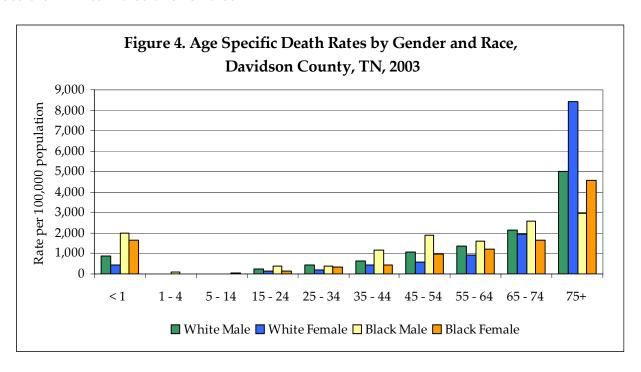

Crude Death Rates by Sex, Race, and Age

The 2003 Davidson County crude death rates (deaths per 100,000 population) by sex and race are shown in Figure 3. The death rate for males (893.0) and females (888.2) were nearly equivalent. The crude death rate for Whites (955.7) was 16.8% higher than the crude death rate for Blacks (818.4). White females had the highest death rate (980.8), while Black females had the lowest death rate (747.7).

Age-specific mortality rates for Davidson County residents during 2003 are depicted in Figure 4. Following the typical J-shaped curve, mortality rates are elevated in the first year of life. This elevation drops dramatically after age 1 year then slowly increases until age 65, when the mortality rate increases sharply. Examining the data by age, sex, and race, reveals that Black males have the highest death rate in each age category with three exceptions. In the 5 to 14 age group, Black females have the highest death rate. White males have the highest death rate in the 25 to 34 age grouping, and White females have the highest death rate in the 75+ age group. Among infants less than one year of age, Black males and females die at a much higher rate than White males and females.

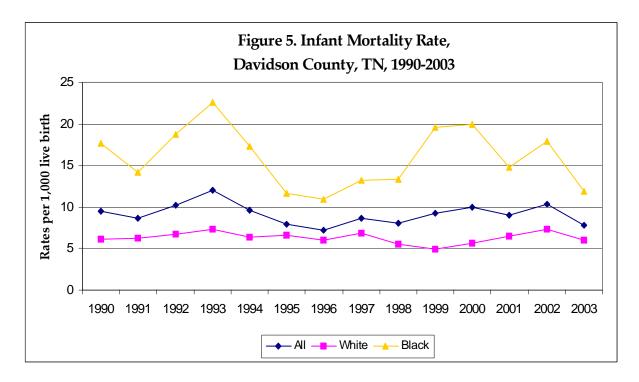

Infant Mortality

In 2003, there were 69 infants who died before reaching their first birthday, resulting in an infant mortality rate of 7.8 deaths per 1,000 live births. The infant mortality rate for Whites in 2003 was 6.0 deaths per 1,000 live births, while the rate for Blacks was 11.9 deaths per 1,000 live births. Black infants died at a rate nearly twice the rate for Whites.

The overall infant mortality rate in 2003 was 24.3% lower than the rate in 2002 (**See Figure 5 on page 4**). Decreases in infant mortality are seen among both Blacks and Whites. The White infant mortality rate in 2003 was 17.8% lower than the rate for Whites in 2002, and the rate for Blacks was 33.5% lower than the rate from the previous year.

Although the most recent data show a decrease in infant mortality rates since 1990, Black infants have consistently died at a rate 2 to 3 times higher than the rate for White infants (**See Figure 5 on page 4**).

Leading Causes of Death

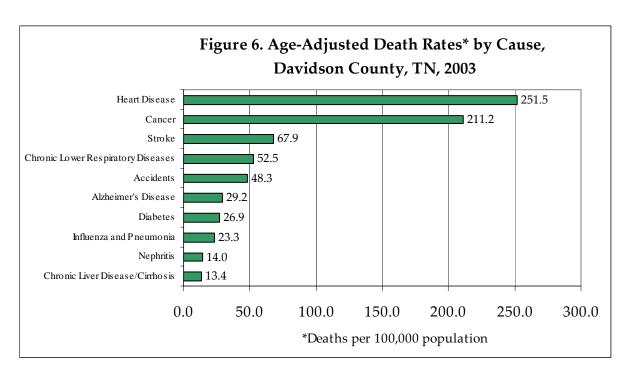

Ten Leading Causes of Death in 2003

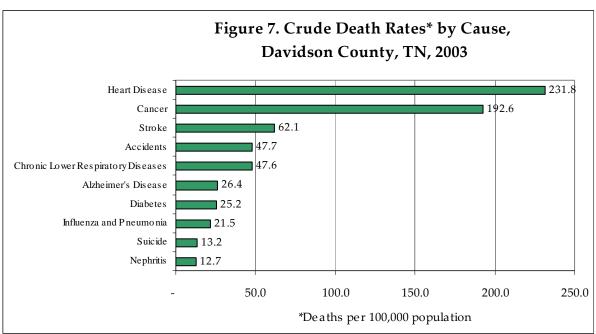

This report uses age-adjusted death rates to identify the ten leading causes of death. Table 1 presents the leading causes of death among Davidson County residents in 2003 by the age-adjusted rate, crude rate, and by the number of years of potential life lost. Years of potential life lost indicates the relative years of life lost for a specific cause of death by subtracting a person's age at death from 75.

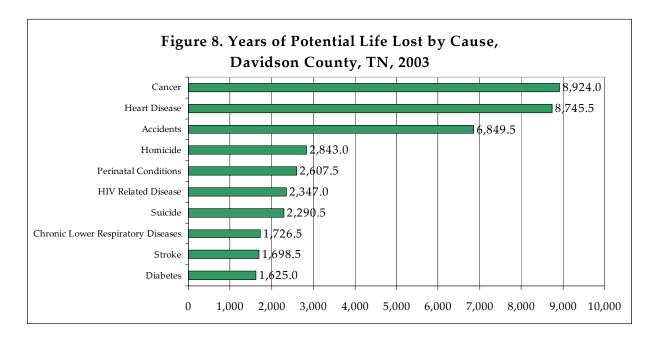

Table 1. Rank of Leading Causes of Death, Davidson County, TN, 2003

Cause of Death	Age-Adjusted Rate	Crude Rate	Years of Potential Life Lost
Heart Disease	1	1	2
Cancer	2	2	1
Stroke	3	3	9
Chronic Lower Respiratory Diseases	4	5	8
Accidents	5	4	3
Alzheimer's Disease	6	6	30
Diabetes	7	7	10
Influenza and Pneumonia	8	8	14
Nephritis	9	12	17
Chronic Liver Disease/Cirrhosis	10	11	12

As Table 1 indicates, the ranking of the ten leading causes of death differs among age-adjusted and crude rates and years of potential life lost. Heart disease and cancer lead in all three categories. While heart disease has the highest age-adjusted and crude rates, more years of potential life are lost due to cancer. Figures 6, 7, and 8 (See Figure 8 on page 6) illustrate the ten leading causes of death among Davidson County residents in 2003 ranked by the age-adjusted rate, crude rate, and the years of potential life lost. It should be noted that while the three leading causes of death based on both crude and age-adjusted rates are heart disease, cancer, and stroke respectively, cancer, heart disease, and accidents account for the most years of potential life lost.

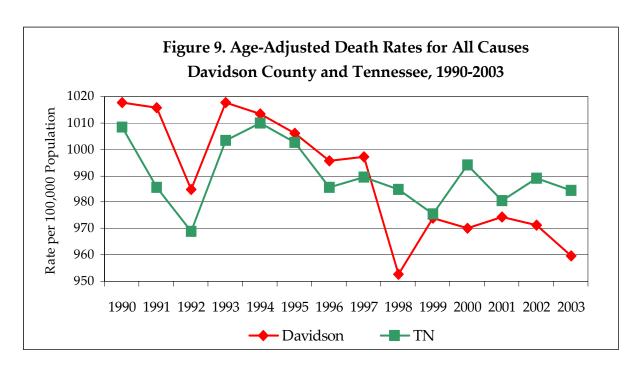

1990-2003 Age-Adjusted Rates

The following section describes the relationship of age-adjusted death rates for all causes in Davidson County compared to Tennessee by sex and race.

Figure 9 illustrates that the death rate from all causes in Davidson County mirrored that for the entire state for the years 1990-1997. During this period, the age-adjusted death rate in Davidson County exceeded that of the state. In 1998, there was a notable drop in the Davidson County death rate and since that year, the age-adjusted death rate in Davidson County has remained below the corresponding rate for Tennessee. In 2003, the age-adjusted death rate in Davidson County was 2.5% below that year for Tennessee.

As demonstrated in Figure 10, the death rates for men, both in Davidson County and across Tennessee, greatly exceed the rates for females. While the age-adjusted death rates for men have declined steadily since 1990, the age-adjusted rates for women have been more constant yet display a slight overall increase until 2001. Since 2001, age-adjusted death rates for females in Davidson County have declined.

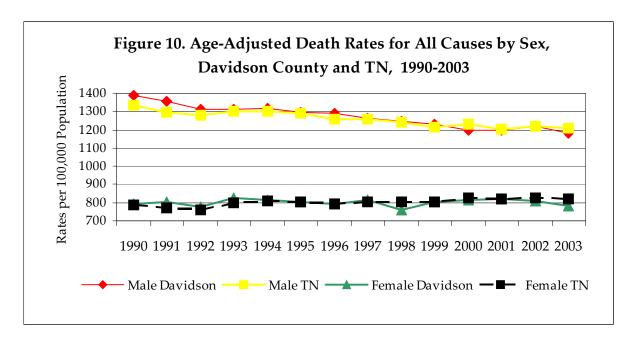

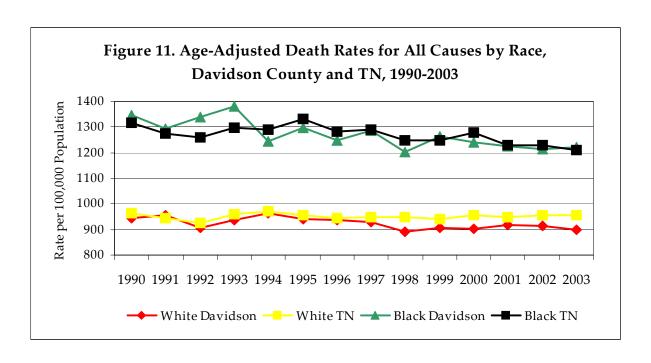

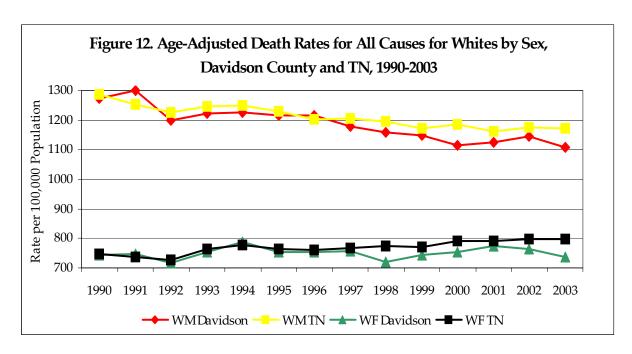

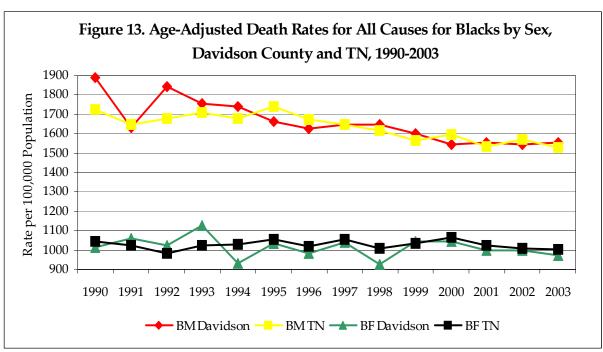

Figure 11 displays the data for Whites and Blacks in Davidson County and Tennessee from 1990-2003. The rates for Blacks exceed those for Whites at the county and state levels. It should also be noted that while the rates for Whites have remained relatively constant, some net improvement can be seen in the rates among Blacks in Davidson County and across Tennessee. In 2003 in Davidson County, the age-adjusted death rate among Blacks was 36.0% higher than the rate seen in Whites.

Figures 12 and 13 display the data by race and sex groups. Figure 12 depicts a narrowing of the gap between White males and White females at the county and state levels. Since 1990, the age-adjusted death rates for White males have decreased, while there has been a slight increase in the corresponding rates for females in the state. In Davidson County, females have experienced a decrease in age-adjusted mortality rates since 2001.

The difference in the age-adjusted death rates between Black males and Black females has also decreased (See Figure 13). The decrease in disparity is due in large part to the decrease in the death rates among Black males while death rates within Davidson County and across Tennessee for Black females remained relatively steady over the 14 year period displayed in the graph.

Sex and Race Differences for the Ten Leading Causes of Death

Some death rates for the ten leading causes of death vary greatly by race and sex. The rates for males exceed the corresponding rates for females with one exception, Alzheimer's disease. The differences were most noticeable for suicide (males 2.9 times females), nephritis (males 1.7 times females), heart disease (males 1.6 times females), cancer (males 1.6 times females), and accidents (males 1.6 times females). The differences were less pronounced for Chronic Lower Respiratory Diseases (CLRD) (males 1.4 times females), stroke (males 1.3 times females), and diabetes (males 1.2 times females). For Alzheimer's disease, women have higher rates than men (females 1.5 times males).

There were also differences in the rates for Whites and Blacks. Blacks experienced higher death rates for heart disease, cancer, stroke, diabetes, influenza and pneumonia, Alzheimer's disease, and nephritis. Whites had higher death rates for CLRD, accidents, and suicide. The death rate for diabetes among Blacks was 2.4 times that of Whites. The death rate of nephritis was 2.6 times higher in the Black segment of the population than it was in the White population. Conversely, the rate of suicide was 2.5 times higher among Whites than Blacks.

The chart book in the Appendix contains figures depicting the age-adjusted death rates for the ten leading causes for all, males, females, Blacks, and Whites.

Ten Leading Causes of Death for Males, Females, Whites, and Blacks

Table 2 lists the ten leading causes of death for males, females, Whites, and Blacks within Davidson County, TN in 2003 based on age-adjusted rates.

A comparison of the leading causes of death for males and females finds some specific differences. The ninth and tenth leading causes of death among males (chronic liver disease/cirrhosis and HIV related disease) are not among the ten leading causes of death for females. Likewise, the ninth and tenth leading causes of death among females (nephritis and hypertension) do not make the top ten list for males. The rank order of the two lists for males and females differ with the relative positions of influenza and pneumonia and Alzheimer's disease.

Table 2. Ten Leading Causes of Death by Sex and Race, Davidson County, TN, 2003

Rank	Males	Females	Whites	Blacks
1	Heart Disease	Heart Disease	Heart Disease	Heart Disease
2	Cancer	Cancer	Cancer	Cancer
3	Stroke	Stroke	Stroke	Stroke
	Chronic Lower Respiratory	Chronic Lower Respiratory	Chronic Lower Respiratory	
4	Diseases	Diseases	Diseases	Diabetes
				Chronic Lower Respiratory
5	Accidents	Accidents	Accidents	Diseases
6	Influenza and Pneumonia	Alzheimer's Disease	Alzheimer's Disease	Accidents
7	Diabetes	Diabetes	Influenza and Pneumonia	HIV Related Disease
8	Alzheimer's Disease	Influenza and Pneumonia	Diabetes	Alzheimer's Disease
9	Chronic Liver Disease/Cirrhosis	Nephritis	Suicide	Influenza and Pneumonia
10	HIV Related Disease	Hypertension	Chronic Liver Disease/Cirrhosis	Nephritis

A comparison of the leading causes of death by race finds similar differences. Suicide, and chronic liver disease/cirrhosis, the ninth and tenth leading causes of death among Whites, were not found among the ten leading causes of death for Blacks. Similarly, HIV related disease and nephritis, the seventh and tenth leading causes of death among Blacks were not found on the top ten list for Whites. While accidents, Alzheimer's disease, influenza and pneumonia, and diabetes are among the ten leading causes of death for Blacks and Whites, their relative positions vary.

Leading Causes of Death by Age

The primary causes of death among Davidson County infants (less than one year old) in 2003 were perinatal conditions and congenital malformations/abnormalities. Together, these causes accounted for over 73.9% of all deaths under one year of age.

The leading causes of death among children aged 1-4 in 2003 were accidents and heart disease. These causes represented 33.3% and 16.7% of the total deaths among Davidson County residents between the ages of 1 and 4 years old respectively.

Among Davidson County residents between 5 and 14 years of age, accidents, CLRD, and cancer were the leading causes of death. Accidents accounted for 42.9% of these deaths, while cancer and chronic lower respiratory disease account for 14.3% each.

Accidents, homicide, and suicide were the three leading causes of death among Davidson County residents between 15 and 24 years old. Accidents accounted for 32.0% of the deaths in 2003 among people in this age category followed by homicide and suicide at 30.7% and 12.0% respectively.

Nearly two-thirds of the deaths among Davidson County residents in 2003 between the ages of 25 and 44 were attributed to accidents, heart disease, cancer, HIV related disease, and suicide. Accidents, heart disease, and cancer were the three leading causes of death accounting for 20.2%, 13.9%, and 12.3% of deaths among this age grouping respectively. Additionally, HIV related disease accounted for 11.1% of deaths and suicide accounted for 7.3% of deaths among Davidson County residents aged 25 to 44 years.

Between the ages of 45 and 64 years, cancer and heart disease accounted for over half of all deaths of Davidson County residents in 2003. Cancer was the cause of 25.9% of the deaths in this age category, while an additional 24.2% of deaths were attributed to heart disease.

Between the ages of 45 and 64 years, cancer and heart disease account for over half of all deaths of Davidson County residents in 2003. Cancer was the cause of 25.9% of the deaths in this age category, while an additional 24.2% of deaths were attributed to heart disease.

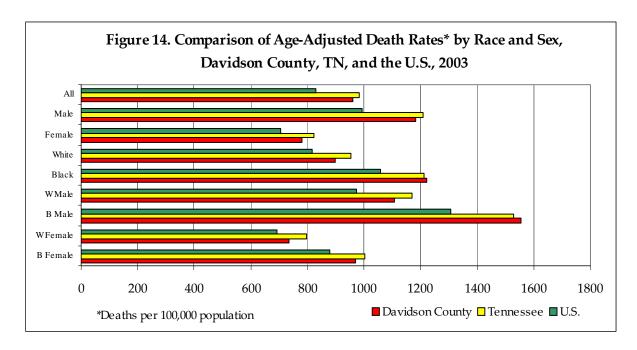

In the oldest segment of the population, those residents 65 years old and older, heart disease and cancer were again the leading causes of death among Davidson County residents in 2003. Heart disease accounted for 29.0% of the deaths in this age group and cancer accounted for an additional 22.6% of the deaths.

Section 3 in the Appendix contains figures depicting the leading causes of death for each of these age groups.

Comparison of Davidson County with Tennessee and United States

Death Rates by Sex and Race

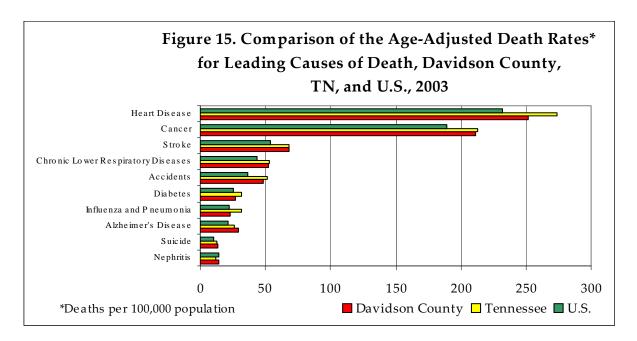

The overall age-adjusted death rate for Davidson County in 2003 was 959.7 per 100,000 while the rate for Tennessee was 984.6, a 2.6% difference. The age-adjusted death rates in Davidson County were lower in all race and sex categories than the comparable rates in Tennessee with the exceptions of the death rates for all Blacks and Black males. It should be noted, however, that all of these differences were relatively small. (See Figure 14).

When compared to the United States (**See Figure 14**), the age-adjusted death rates for Davidson County in 2003 as a whole and for each race and sex category were substantially higher. The overall age-adjusted death rate for Davidson County was approximately 15.5% higher than the rate for the United States, 959.7 compared to 831.2. The largest difference among race and sex categories was among Black males. The age-adjusted rate for Black males was 1556.5 per 100,000 in Davidson County compared to 1308.2 per 100,000 across the United States, a 19% difference.

Ten Leading Causes of Death

The Davidson County age-adjusted death rates for nephritis and suicide were higher in 2003 than the comparable Tennessee rates. These include nephritis and suicide. The rate for stroke was the same in Davidson County and Tennessee (67.9 per 100,000). The Davidson County age-adjusted death rates for Alzheimer's disease, influenza and pneumonia, accidents, chronic lower respiratory diseases, heart disease, cancer, and diabetes were all lower than the corresponding rates for Tennessee. (See Figure 15 on page 12).

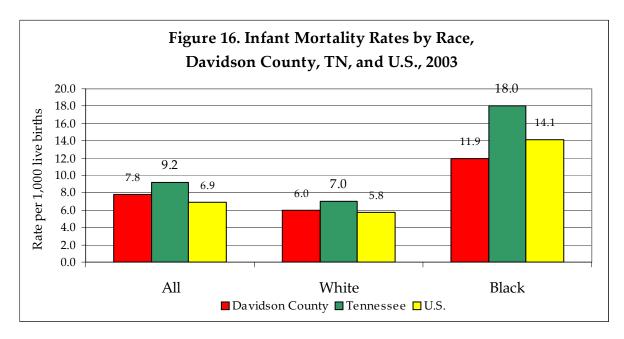

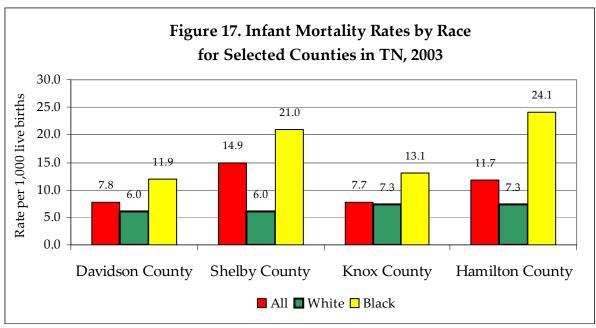

The age-adjusted death rates for nine of the ten leading causes of death in Davidson County were higher than the comparable rates for the United States. The one exception was nephritis: the Davidson County rate was 14.0 per 100,000 compared to the United States rate of 14.5 per 100,000. The largest difference was seen in cancer where the Davidson County rate was 211.2 compared to 189.3 per 100,000 in United States. Figure 15 compares the rates of the ten leading causes of death in Davidson County with the corresponding rates for the United States and Tennessee.

The overall infant mortality rate for Davidson County in 2003 was 7.8 deaths per 1,000 live births (See Figure 16 on page 13). This rate was 15.2% lower than the rate for Tennessee, and 13.0% higher than the national infant mortality rate. Examining infant mortality by race reveals that the White infant mortality rate in Davidson County was 14.3% lower than the White rate for Tennessee, but was 3.4% higher than the national rate. Tennessee has the highest Black infant mortality rate (18.0 deaths per 1,000 live births) of the three comparisons, with the Black infant mortality rate in Davidson County being 33.9% lower than that of the State. The Black infant mortality rate in Davidson County was also 15.6% lower than the national rate.

Comparing the infant mortality rates in Davidson County with those of three other metropolitan counties in Tennessee, namely Hamilton (Chattanooga, Knox (Knoxville), and Shelby Counties (Memphis), yields some important observations (**See Figure 17 on page 13**). All rates discussed are per 1,000 live birth. Overall, Shelby County has the highest infant mortality rate (14.9), followed by Hamilton County (11.7). Knox County has the lowest infant mortality rate of all areas compared (7.7).

Examining the differences in infant mortality by race reveals a large disparity between Whites and Blacks. This disparity is evident in all of the areas under comparison. Knox and Hamilton Counties have the highest rates for Whites (7.3 each), followed by Shelby and Davidson Counties (6.0 each). For Blacks, Hamilton County has the highest infant mortality rate (24.1), followed by Shelby County (21.0).

Comparison of Davidson County with Healthy People 2010 National Objectives

Healthy People 2010 defines the national health objectives that have been set for the United States to strive for during the first decade of the 21st century. These objectives are outlined in 28 focus areas. Six of the ten leading causes of death and infant mortality in Davidson County have a corresponding national objective. The table below shows the age-adjusted death rates for these six leading causes and infant mortality with the national objective and the percent difference between the two. With the exception of diabetes, the current age-adjusted rates in Davidson County fall short of the national objectives for 2010. The largest difference is seen among the age-adjusted rate for accidents where the local rate is 176.0% higher than the 2010 target. With regards to infant mortality, Davidson County is 73.3% higher than the 2010 target.

Table 3. Percent Difference in Age-Adjusted Death Rate for Leading Causes and Infant Mortality in Davidson County, TN in 2003, Compared to Healthy People 2010 Objectives

2	Cancer	98	126.7	
3	Accidents	30	38.8	
4	Stroke	26	33.6	
5	Chronic Lower Respiratory Diseases	17	22.0	

^{*} Rate per 100,000 population calculated using 2000 census data as denominator

Table 150. Leading Causes of Death, Number of Deaths, and Crude Death Rate*

	Planning District 13: Priest Lake/Antioch			
Rank	Cause	Number of Deaths	Rate	
1	Cancer	72	107.9	
2	Heart Disease	60	89.9	
3	Accidents	23	34.5	
4	Stroke	14	21.0	
4	Chronic Lower Respiratory Diseases	14	21.0	
5	Influenza and Pneumonia	11	16.5	

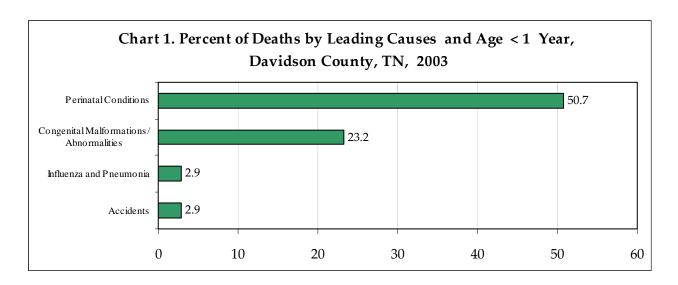

^{*} Rate per 100,000 population calculated using 2000 census data as denominator

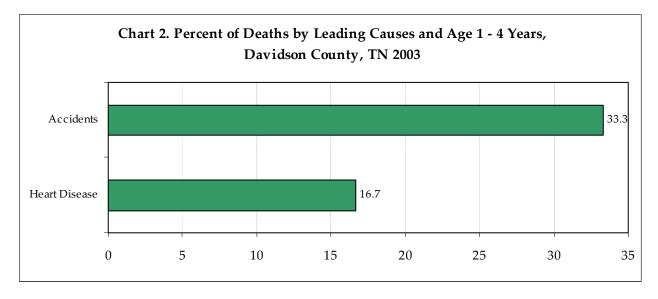

Table 15p. Leading Causes of Death, Number of Deaths, and Crude Death Rate*

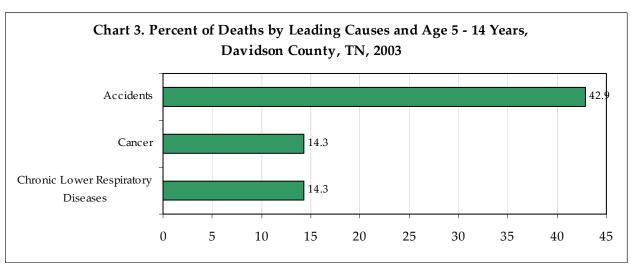

Planning District 14: Donelson/Hermitage			
Rank	Cause	Number of Deaths	Rate
1	Heart Disease	132	222.4
2	Cancer	125	210.6
3	Stroke	40	67.4
4	Chronic Lower Respiratory Diseases	37	62.4
5	Accidents	24	40.4

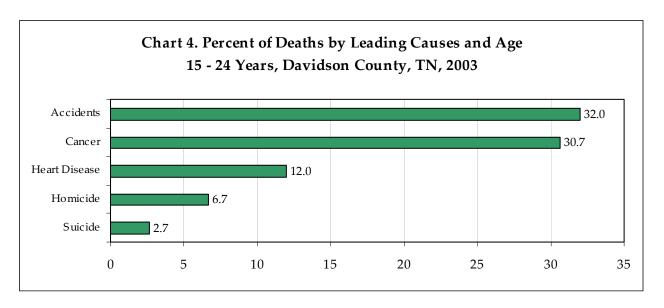

^{*} Rate per 100,000 population calculated using 2000 census data as denominator

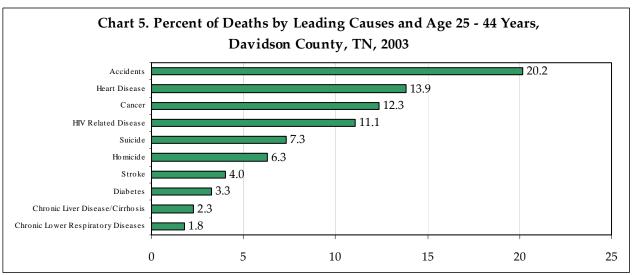

Section Three: Leading Causes of Death by Age Group

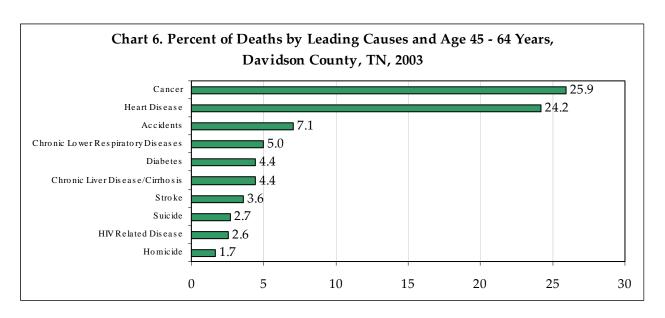

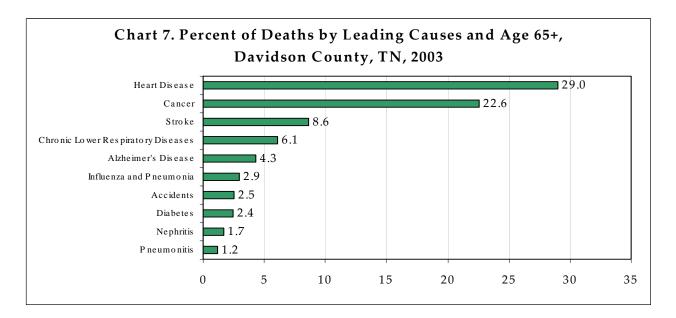

Section Four: Age-Adjusted Death Rates for Selected Causes of Death by Sex and Race
